

## Electric mobility for your vehicle fleet.

Charge your vehicles anywhere and receive one single bill with the MobileCharging system – just like using a fuel card for regular cars.

# Affordable infrastructure – straightforward billing: mobile power for fleets.

Electric mobility is taking off. Although this is being greeted with increasing enthusiasm from end customers, it is presenting vehicle fleet operators with a challenge. Mastering the crossover to electric mobility requires a smart and economically convincing solution.

ubitrlicity's MobileCharging system solves two key problems: setting up an economical infrastructure and the desire for billing to a single cost centre. The economical SimpleSockets allow you to create multiple

charging points – both at your place of business and employees' homes. Whether you charge your vehicles using the SimpleSockets or at external providers' charging stations when out and about, all charging procedures are recorded on one bill – giving an accurate consumption reading for each vehicle. **The MobileCharging system allows you to easily integrate electric vehicles into your fleet and equip your company for the future of mobility.**

- ✓ **As easy to use as a fuel card:** All charging procedures are itemised per vehicle on one bill – including those undertaken at external providers' charging stations.
- ✓ **Economical infrastructure:** The technologically streamlined SimpleSockets can be installed anywhere – including at employees' homes.
- ✓ **Straightforward reimbursement:** The person driving the company car or fleet vehicle is reimbursed directly for all costs created at their home charging spot.
- ✓ **Flexible access management:** Drivers of company cars and fleet vehicles receive their own personal access data for the customer portal.

## The MobileCharging system for fleets

**SmartCable –**  
including green power contract.

Every vehicle is equipped with a SmartCable featuring a mobile electricity meter and mobile power contract. Charging at a SimpleSocket requires successful authorisation, records consumption exactly and translates the costs transparently into one bill.

**SimpleSockets –**  
charging spots wherever you like.

SimpleSockets come in various installation types. The fact that they do not feature any static communication, access or billing technology makes them particularly affordable – allowing you to easily set up charging infrastructure.

**ConnectivityManager –**  
everything always at your fingertips.

The customer portal ConnectivityManager gives both the driver and the company a transparent overview of all bills, contract data and charging transactions – real-time and in compliance with data protection laws.

# One SmartCable. One bill.

As easy as using a fuel card.

A solution is convincing if it covers all everyday applications and offers a convenient solution for every challenge. ubitricity's MobileCharging system does just that. With economical charging infrastructure everywhere, you can bill to the desired cost centre without difficulty – whether users charge at home or out and about. For drivers, it's as simple as a conventional fuel card. Data security is also a top priority for ubitricity: all usage and

transaction data is transferred to ubitricity by way of secure encryption. Hardware components and the ConnectivityManager can be designed to feature your logo and corporate company colours, where required.

**All of this makes the MobileCharging system an all-round well-designed e-mobility solution – tailored to the needs of your fleet.**

## Charging vehicles on the go – everyday, everywhere.

7:00 pm – 8:30 am

### At home

The driver of the fleet/company car starts off at home. The electric car has been charged overnight by connecting the SmartCable to the technologically streamlined SimpleSocket. The employer accepts the costs for charging the vehicle using a private electricity supply – based on accurate transaction recordings transmitted by the SmartCable.

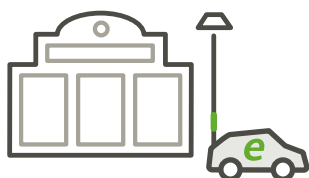

9:00 am – 2:30 pm

### At work

Drivers also have charging spots available at work: the SimpleSockets, which incur virtually no operating costs, allow infrastructure to be set up anywhere at low cost. Simply plug in and charge with the SmartCable. The amount of electricity used to charge the vehicle is recorded exactly using the mobile meter in the SmartCable and the bill is generated by ubitricity.

3:00 pm – 4:30 pm

### Out and about

Naturally, the driver also uses the electric vehicle when out and about. There are increasingly more SimpleSockets available in towns and cities, where drivers can easily charge their vehicles using the SmartCable.

SimpleSockets can be installed on the wall, attached to bollards and even integrated in lamp posts. The ConnectivityManager tells the driver where to find the nearest charging spot.

5:00 pm – 6:30 pm

### External provider

Charging your vehicle at an external provider's charging station is just as easy because the SmartCable works at every charging station. These charging costs are also listed on the monthly bill.
